Chapter 1

Introducing Gann Grids

This chapter provides an overview of the Gann Grids product and summarizes the key features and benefits of Gann Grids. The steps required to start using Gann Grids right away are also summarized.

1.1 What is Gann Grids?

Gann Grids is a charting application. Gann Grids will read almost all stocks, commodities and indexes from ASCII formatted files. Gann Grids will then print this information in the legendary W.D. Gann chart format.

04/19/2001 - 05:00 PM

Page 1

Features

Gann Grids lets you choose the look and feel of your chart. Gann Grids allows you to adjust:

- The color of the data displayed.
- The number of lines per inch that appear on the chart.
- The dollar value of each line.
- The displayed dollar amount.
- The date range to be printed.
- The dollar range to be printed.

1.2 Quick Start

This section summarizes the steps required to start using Gann Grids. For detailed steps for installing, configuring, and using Gann Grids, refer to chapters 2, 3 and 4.

NOTE: These steps assume that you will use the default settings provided by Gann Grids unless otherwise specified.

Installing Gann Grids

1. Double click **SETUP.exe** and follow on screen instructions

Opening and Printing your data

1. Using **Open** from the file menu, open your file
2. Select **Print** from the file menu to print your data

Chapter 2

Installing Gann Grids

This chapter provides information about installing Gann Grids on your computer. It explains how to install Gann Grids using the setup program as well as describing the minimum system requirements needed to run Gann Grids.

2.1 System Requirements

To install and run Gann Grids, you require the following:

- Windows 98, Windows ME, Windows NT Workstation 4.0 with Service Pack 6a or higher, Windows Professional 2000 or Windows XP.
- 8 megabytes (MB) of hard disk space.
- 16 MB of RAM.
- An Intel Pentium-Class or compatible processor rated 100 MHz or Higher.
- CD-Rom (Required only if installing from a cd).
- Internet Explorer 5.0 or higher (For accessing online help).
- A printer.

2.2 Installation Steps

To install Gann Grids, follow these steps:

NOTE: If installing from Gann Grids installation CD, insert CD into CD-Rom drive. If installing from an archive obtained via download, extract the files to your hard drive.

1. From the Windows Start Menu, select **Run**.
2. Type <X>:\SETUP.exe in the text box provided, then click **OK**.
Here, <X> represents the drive letter of your CD-Rom drive or the path to the folder that contains the extracted Gann Grids files. To search for the proper files on your hard drive or CD-Rom, click **Browse**.
3. Follow on screen instructions to complete installation of Gann Grids.

To access the documentation installed with Gann Grids, follow these steps:

1. From the Windows Start Menu, select **Run**
2. Type <X>:\ Acrobat\ar505enu.exe in the text box provided, then click **OK**.
Here, <X> represents the drive letter of your
CD-Rom drive. To search for the proper files
on the CD-Rom, click **Browse**.
3. Follow the on screen instructions to complete installation of Adobe Acrobat
Reader 5.05.

Chapter 3 Configuring Gann Grids

This chapter explains how to configure the many options of Gann Grids. All options can be found under **Tools** → **Options**.

NOTE: To resort the original Gann Grids settings click on the “**Restore Default Values**” button.

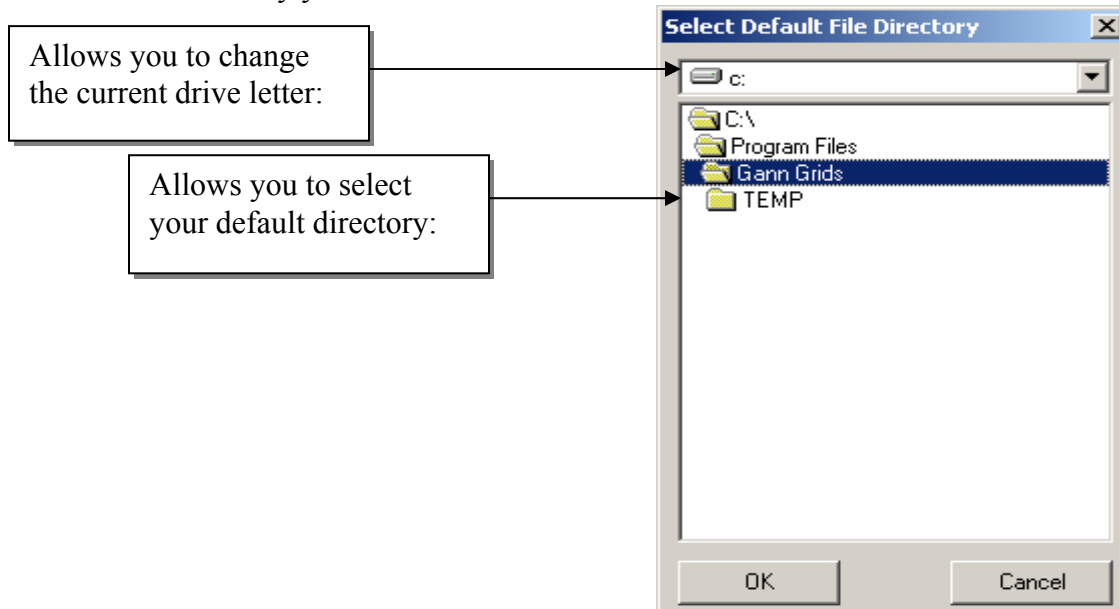

3.1 Data Definition Setup

Setting up your data definition is the most crucial step in configuring Gann Grids. The data definition is what lets Gann Grids know how to read your ASCII data files.

3.1.1 Choosing Your Default File Location

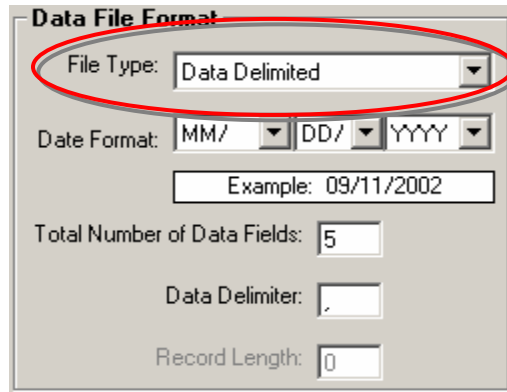

Your default file location is the first directory you want Gann Grids to go to when you open a file. The default location can be set either by typing it in or by clicking on the “**File Location**” button which will allow you to search for the default directory you want to use.

3.1.2 Choosing Your File Format

The ASCII data file format you select is dependent on how your files are setup. Gann Grids allows you to use two different types of ASCII data file formats:

- Data Delimited.
- Fixed Record Length.

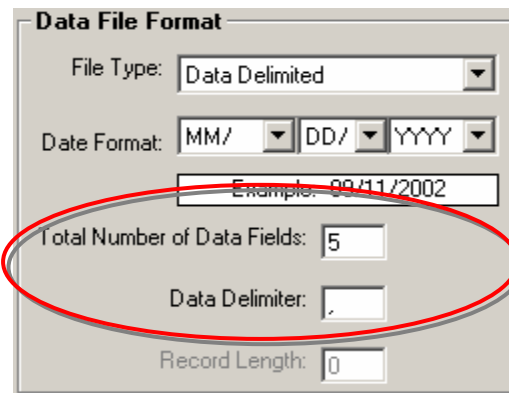

The screenshot shows a dialog box titled "Data File Format". The "File Type" dropdown menu is set to "Data Delimited" and is circled in red. Below it, the "Date Format" is set to "MM/DD/YYYY" with an example date "09/11/2002" displayed in a text box. The "Total Number of Data Fields" is set to "5", the "Data Delimiter" is set to ".", and the "Record Length" is set to "0".

Data Delimited

A **data delimited** file is a file where all the information (fields) is separated by a special character. The most commonly used special character is the “,”.

For example: 01/01/2002,123.45,123.45,123.45,123.45

You must specify the number of total fields in your data file as well as the data delimiter used in your file. In this example, the total number of fields is **5** and the data delimiter is “,”.

The screenshot shows the same "Data File Format" dialog box. In this view, the "Total Number of Data Fields" field is circled in red. The "File Type" is still "Data Delimited", the "Date Format" is "MM/DD/YYYY" with the example "09/11/2002", the "Data Delimiter" is ".", and the "Record Length" is "0".

Fixed Record Length

A **fixed record length** is a file in which all the records are exactly the same length and each field starts in the same position.

For example: 01/01/2002123.45123.45123.45123.45

You must specify the fixed length of the records in your ASCII data file. In this example, the fixed record length is 34.

The screenshot shows a dialog box titled "Data File Format". It contains several controls: a "File Type" dropdown menu set to "Fixed Record Length"; a "Date Format" section with three dropdown menus for "MM/", "DD/", and "YYYY"; an "Example" text box containing "09/11/2002"; a "Total Number of Data Fields" text box with the value "0"; a "Data Delimiter" text box that is empty; and a "Record Length" text box with the value "34". The "Record Length" text box is circled in red.

NOTE: You must select the correct file format or you will not be able to read any of your ASCII data files.

3.1.3 Choosing Your Field Format

Your data field format is dependent on which ASCII file format you are using and in what order the data is stored. The fields in each file format represent the **Open**, **Close**, **High**, **Low** and **Date** for one record of information.

Field Format for Data Delimited Files

As described in the previous section all information (we will refer to the information as fields from here on in) in a data delimited file is separated by a special character. Each field in this type of file has a location associated with it.

Field location:	1	2	3	4	5
For Example:	01/01/2002,	123.45,	123.45,	123.45,	123.45

In this example the following location format is being used:

Field Name	Field Location
Date	1
Open	2
Low	3
High	4
Close	5

Gann Grids needs to know these field locations if it is going to properly interpret your data file.

	Location	Start Position	Length
Date:	1	0	0
Open:	2	0	0
Low:	3	0	0
High:	4	0	0
Close:	5	0	0

Field Format for Fixed Record Length Files

As described in the previous section all information (we will refer to the information as fields from here on in) in a fixed record length file, starts in the same position for every fixed record. Each field in this type of file has a start position and a length associated with it.

In this example the following format is being used:

Field Name	Start Position	Length
Date	1	10
Open	11	6
Low	17	6
High	23	6
Close	29	6

Gann Grids needs to know these field positions and lengths if it is going to properly interpret your data file.

Data Field Format

Location	Start Position	Length
Date: 0	1	10
Open: 0	11	6
Low: 0	17	6
High: 0	23	6
Close: 0	29	6

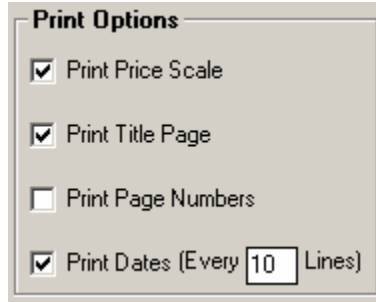

3.2 Program Options

This section of the Gann Grids configuration allows you setup how Gann Grids will printout your data. Gann Grids allows you to change the look and feel of you data charts.

3.2.1 Choosing Your Print Options

These options allow you to choose what information gets printed out along with your data chart. Gann Grids allows you to:

- Print a Title Page.
- Print the Price Scale.
- Print Dates.
- Print Page Numbers.

What's on the Title Page?

The title page that prints out with your data chart contains the following information:

- File name – The name of the file that Gann Grids is printing.
- Actual file low – The lowest “Low” value in your ASCII data file.
- Actual file high – The highest “High” value in your ASCII data file.
- Price adjustment – Decimal display adjustment value.
- Printed date range – The date range within your file to be printed.
- Chart range – Dollar range that will be printed.
- Chart price – The increment value used within the chart range.
- Total number of pages – The total number of pages (NOT including the title page) that will be printed.
- The number of Tall by Wide pages to be printed.

What is the Price Scale?

The price scale is the dollar values that print on the side of the chart.

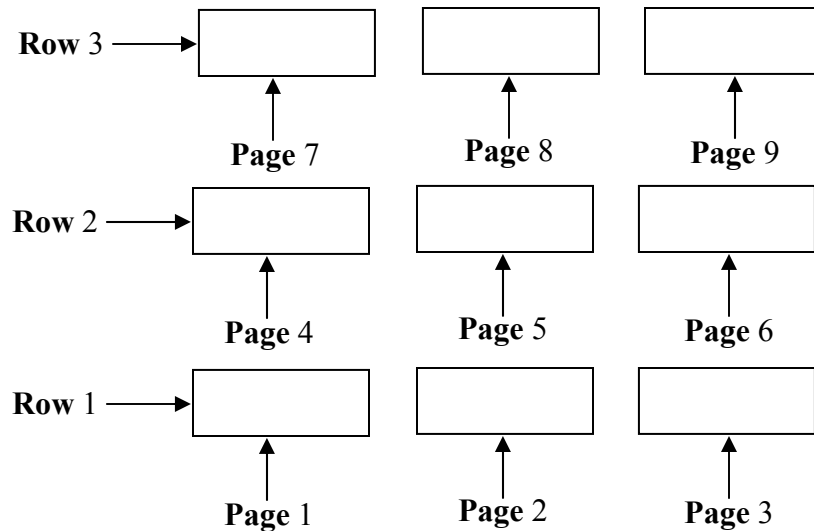

Page Number Formats

Gann Grids uses two different formats when displaying page numbers on the data chart printouts.

- **Page** (current page number) **Row** (current row number)
- **Page** (current page number)

The first format is used when printing both **TALL** and **WIDE** pages.

For Example:

In this example, there are 3 **TALL** pages by 3 **WIDE** pages for a total of 9 pages.

The second format is used when the chart will fit on one row.

For Example:

In this example, there is 1 **TALL** page by 3 **WIDE** pages for a total of 3 pages.

NOTE: Gann Grids will decide which page number format to use based on one of the previously mentioned formats it needs to print your data.

Printing Dates

Gann Grids allows you to print the dates associated with your ASCII data file; however, Gann Grids needs to know where you would like the dates to be printed. You must specify the number of lines between the dates.

For Example: Print Dates (Every Lines)

In this example, the dates are printed on every 10 lines.

3.2.2 Choosing Your Chart Options

These options allow you to choose how your chart will look and how the data will be represented. Gann Grids allows you to choose:

- The Grid Size.
- The Chart Price.
- The Graph Density.
- The Line Color.

Chart Options	
Grid Size: <input type="text" value="10"/>	
Chart Price: <input type="text" value="1.00000"/>	
Graph Density: <input type="text" value="Dark"/>	
<input type="text" value="Line Color"/>	

The Grid Size

The grid size is the number of lines per inch to be printed. Each box on the chart takes up exactly 1" by 1" of paper.

For Example:

In this example the Grid Size is **10**, which means that there will be 10 data records printed per every square inch of paper.

The Chart Price

The chart price is the dollar value of each line along the price scale of the chart.

For Example:

In this example the chart price is **1** and the grid size is **10**. This means that each line along the price scale is \$1 and the total change per inch is \$10.

Another Example:

In this example the chart price is 4 and the grid size is 10. This means that each line along the price scale is \$4 and the total change per inch is \$40.

NOTE: The chart price can range from 0.00001 to 32.00000.

The Graph Density

The graph density allows you to change how dark or light the chart will appear. Gann Grids has three graph densities:

- Light.
- Normal.
- Dark.

This is an example of what a **LIGHT** graph would look like.

This is an example of what a **NORMAL** graph would look like.

This is an example of what a **DARK** graph would look like.

NOTE: The graph density does not effect how the data lines will be printed. To change the color of the data lines please refer to the next section.

The Line Color

Gann Grids allows you to change the color of the data lines that are printed. The data lines are the actual information displayed on the chart. (I.E. The stock high, low, open and close.)

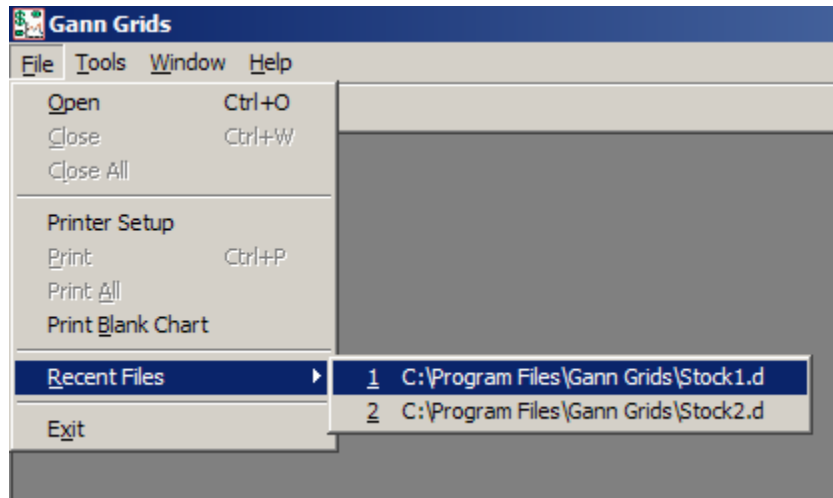

For Example:

The data lines for this example would be printed out in red.

3.2.3 What is a “Most Recently Used List”?

The “Most Recently Used List” or MRU for short is a list of the five most recently opened files. The MRU list can be found by clicking **File → Recent Files**.

The MRU list can be cleared by clicking the “**Clear Most Recently Used List**” button from the **Program Options** tab located under **Tools → Options**.

Chapter 4

Using Gann Grids

This chapter explains how to open and print your ASCII data files. The chapter will also explain how to read the chart printout.

4.1 How to Read the Chart

This section explains how to read the chart that is printed by Gann Grids. As previously mentioned in chapter 1, Gann Grids prints charts in the W.D. Gann format. The time can be days, weeks, months or years and the price scale is initially determined by the information in your ASCII data file; however, it can be changed when modifying the print ranges.

For Example:

04/19/2001 - 05:00 PM

Page 1

In this example, the chart is read in the following order.

Each box in the Gann Grids chart is exactly 1" by 1".

For Example:

Each box is then broken down into a grid size. In the previous example, the grid size is **10**. The grid size determines the number of lines per inch. In the previous example, each chart box is broken down into 1/10's of an inch.

This next example assumes the following:

- Grid size is **10**.
- Chart price is **1**.
- The ASCII data file is broken down by day.

This means that for each inch along the time scale ten days of information is displayed and for every inch along the price scale, the chart increases by \$10.

The data in your ASCII data file is represented on the chart in the following way.

When connecting more than one chart page together, cut along the *top* and *right* solid edge lines of the page.

For Example:

4.2 Opening and Closing Files

This section explains the various ways of opening and closing files using Gann Grids. This section will also discuss some error messages and information messages you might receive when opening an ASCII data file.

NOTE: Gann Grids allows you to open a maximum of 5 ASCII data files at the same time.

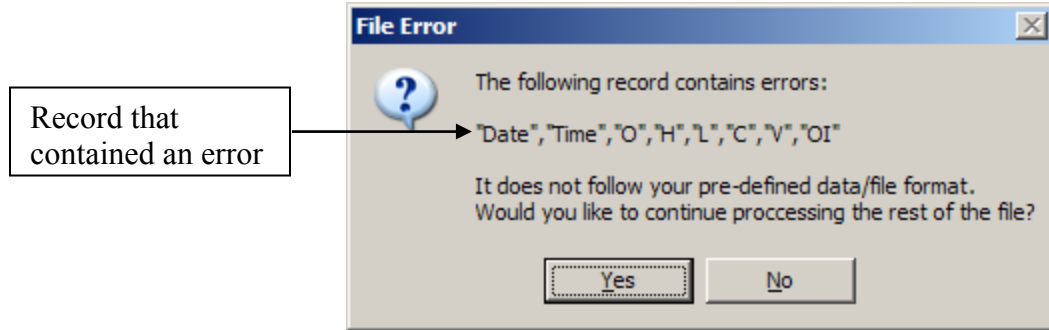

Opening an ASCII Data File

There are three ways to open an ASCII data file in Gann Grids.

- Clicking **File** → **Open**.
- Clicking **File** → **Recent Files**.
- Clicking on the open icon  on the toolbar.

Error and Information Messages

After selecting which ASCII data file you want to open, you might receive the following messages:

This message means that Gann Grids has encountered an error while reading your file. The error message displays the record that had errors and gives you the option to ignore the record and continue, or to stop reading the data file. Clicking **Yes** will ignore the error and continue processing the data file. Clicking **No** will stop processing the file.

NOTE: Not all record errors are bad. In the previous example, the failed record contained information about the data that is in your file. This is a safe error and it would be ok to continue processing the file. Please read all error messages completely before selecting **YES** or **NO**.

This message is for information purposes only. It tells you the number of records that were in the file and how many of the records contained errors.

This message is for information purposes only. It tells you how many **TALL** pages by **WIDE** pages will be needed in order to print the ASCII data file. In this example, the number of pages needed to print the ASCII data file would be 3.

Closing an ASCII Data File

There are three ways to close an ASCII data file in Gann Grids.

- Clicking **File** → **Close** will close the active **Data File** window.
- Clicking **File** → **Close All** will close all open **Data File** windows. (This option is only available if more than one data file window is open.)
- Clicking on the close icon  on the toolbar.

4.2.1 What is the “Data File” Window?

The data file window is where all the information about your data file is stored.

For Example:

The data file window displays the following information:

- The Starting date in the data file.
- The Ending date in the data file.
- The lowest “Low” value in the data file.
- The highest “High” value in the data file.
- The current print range.
- The current chart options.

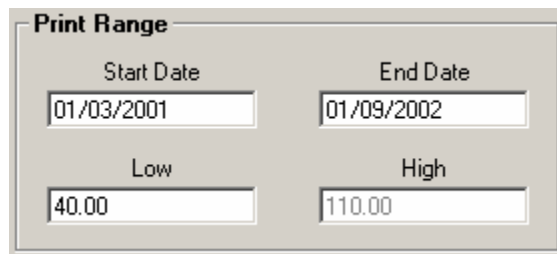

4.3 Change Print Range and Chart Options

This section explains how to change the print range and chart options used by Gann Grids to print the ASCII data file.

NOTE: Changing the **Grid Size** or **Chart Price** will not change the default values used by Gann Grids when an ASCII data file is opened. In order to change the default values click **Tools** → **Options**.

Print Range

These options allow you to choose which information in the ASCII data file that will be printed. Adjust the **Start Date** and/or **End Date** if you would like to print only a certain time frame in the ASCII data file. Adjust the **Low** if you would like to print only a certain price range in the ASCII data file.

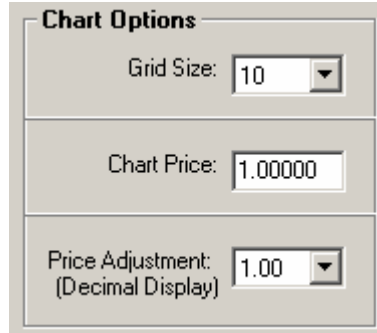

The screenshot shows a dialog box titled "Print Range" with a light gray background. It contains four input fields arranged in a 2x2 grid. The top-left field is labeled "Start Date" and contains the text "01/03/2001". The top-right field is labeled "End Date" and contains the text "01/09/2002". The bottom-left field is labeled "Low" and contains the text "40.00". The bottom-right field is labeled "High" and contains the text "110.00".

NOTE: The **High** value can not be adjusted. Gann Grids will automatically calculate the **High** value based on the default paper size of your printer.

Chart Options

These options allow you to choose how the information in the ASCII data file will appear when it is printed out.

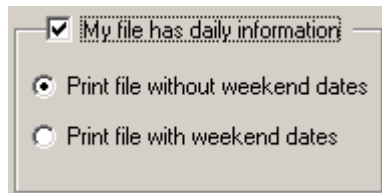

The values for the **Grid Size** and **Chart Price** are the default values which were selected when configuring Gann Grids. Please refer to Chapter 3 Section 3.2.2 to learn more about how the **Grid Size** and **Chart Price** effect the print out.

The **Price Adjustment:(Decimal Display)** allows you to move the dollar decimal point of every value in the ASCII data file either to the left or to the right. Adjusting the stock value will allow control of how much of the chart the ASCII data file will take up. Adjusting the value will not affect the look of the graph. The following equation is used when adjusting the values for display.

$$\text{Display Value} = (\text{Value} * \text{Price Adjustment Value})$$

Inserting Weekend Dates

This option allows you to choose if you would like Gann Grids to complete your *Daily* ASCII data file by inserting the missing weekend dates. If this option is selected, Gann Grids will insert the missing *Saturday* and *Sunday* dates into your chart.

NOTE: This option can only be used if your ASCII data file contains daily information. The newly added days will not contain any information. These will print as blank lines and are used only to create a complete 7 day chart cycle.

4.4 Printing the ASCII Data File

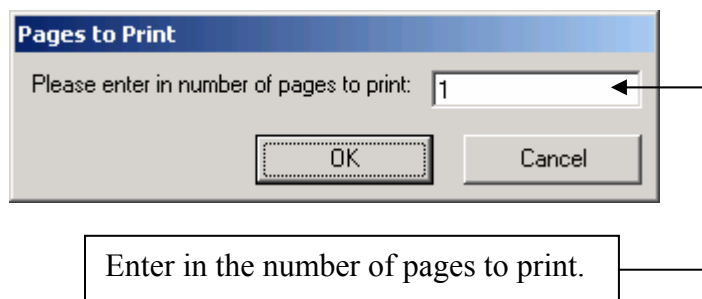

This section explains the three ways to print the ASCII data file.

- Clicking **File → Print**.
- Clicking **File → Print All**. (This option is only available if more than one data file window is open and if all data file windows have valid print ranges.)
- Clicking on the print icon  on the toolbar.

NOTE: Gann Grids will print to your default printer using your default print settings. Use **File → Printer Setup** to print to a different print or to change your print settings.

4.5 Printing Blank Charts

This section explains how to print out blank charts for manual graphing. To print out blank charts, click **File → Print Blank Charts** or click  on the toolbar.

Customer Support

You should have read through the manual on the CD before contacting Gann Grids Customer Support through Aldazar. Additionally, if you have internet access, check out our support area at <http://www.aldazar.com/programming/ganngrids> and our forum at <http://www.aldazar.com/forum>.

Please ensure that your computer system meets the minimum system requirements that are listed on the back of the insert. Our Customer Support representatives will not be able to help customers whose computers do not meet the requirements. So that we can better help you, please have the following information ready:

- Complete product title (include version number)
- Exact error message reported (if any) and a brief description of the problem
- Your computer's processor type and speed (e.g. Pentium 200 Mhz)
- Amount of RAM
- Make and model of your CD-ROM or DVD-ROM drive (e.g. Samsung SC-140)
- Operating system

Note: *Internet/e-mail support is handled in English only.*

Internet

<http://www.aldazar.com/programming/ganngrids>

Our support section of the web has the most up-to-date information available including patches that can be downloaded free-of-charge. We update the support pages often so please check here first for solutions.

E-Mail

support@aldazar.com

The best way for you to help us aid you is through the use of the E-Mail Support Request Form. Simply click on the Report Problem link from our Support section of our website, You can also email us directly at the above e-mail address. Please ensure you include all of the bulleted information asked for above for the computer you are running the program from when emailing to the above address. A response may take anywhere from 24-72 hours depending on the volume of messages we receive and the nature of your problem.

Please do not send any program returns directly to Aldazar. It is our policy that program returns must be dealt with by the retailer or online site where you purchased the product.
